

Lesson 2-5: Perpendicular Lines

Definition of perpendicular lines: two lines that intersect to form four right angles

Ex 1: In the diagram, $\overline{AB} \perp \overline{CD}$ and $\overline{EF} \perp \overline{GH}$. Name eight right angles.

↑ perpendicular to

$\angle AOD$ $\angle FOH$
 $\angle EOG$
 $\angle EOH$
 $\angle FOB$
 $\angle DOB$
 $\angle COB$
 $\angle AOC$

Ex 2: In the diagram, $\overline{BE} \perp \overline{AC}$ and $\overline{BD} \perp \overline{BF}$. Complete the given table.

$m\angle CBF$	$m\angle EBF$	$m\angle DBE$	$m\angle DBA$	$m\angle DBC$
40°	50°	40°	50°	130°
x°	$(90-x)^\circ$	x°	$(90-x)^\circ$	$(90+x)^\circ$

Ex 3: Solve for x using the diagram from example 2.

$m\angle ABD = 6x$, $m\angle DBE = 3x + 9$, $m\angle EBF = 4x + 18$, $m\angle FBC = 4x$

$$6x + 3x + 9 = 90$$

$$\begin{aligned}
 9x + 9 &= 90 \\
 9x &= 81 \\
 x &= 9
 \end{aligned}$$

Complete the following.

- 1) In the diagram, $\overrightarrow{OZ} \perp \overrightarrow{PQ}$, $\overrightarrow{OZ} \perp \overrightarrow{XY}$, and $\overrightarrow{PQ} \perp \overrightarrow{XY}$. Name eight right angles.

- 2) Use the given diagram to solve for x given that $\overrightarrow{BE} \perp \overrightarrow{AC}$ and $\overrightarrow{BD} \perp \overrightarrow{BF}$.

A) $m\angle ABD = 2x - 15$, $m\angle DBE = x$

B) $m\angle DBE = 3x$, $m\angle EBF = 4x - 1$

- 3) Solve for x and y .

- 4)
